

NovaCart

Customer Support Policy

Document Type: Customer & Support Knowledge Base Policy

Version: 1.0

Status: Active for Autonomous Customer Support Copilot Demo

Support Channel	AI Copilot, customer support team and ticket system
Support Hours	Monday–Sunday, 9:00 AM–9:00 PM IST
Response Goal	Provide accurate, concise and policy-supported assistance
Ticket Rule	Normal conversation and simple FAQs do not normally create tickets
Human Support	Available when investigation, verification or authorized action is required
Support Email	support@novacart.example

1. Purpose

This Customer Support Policy defines how NovaCart should provide customer assistance through the Autonomous Customer Support Copilot and human support team.

The goal is to resolve customer questions accurately, avoid unnecessary tickets, collect only necessary information, and escalate issues when human investigation or authorized action is required.

2. Support Philosophy

NovaCart support should be:

- Customer-focused.
- Accurate and policy-based.
- Clear and easy to understand.
- Respectful and professional.
- Transparent about limitations.
- Secure when handling customer information.
- Consistent across AI and human support channels.

3. AI First-Line Support

The Autonomous Customer Support Copilot acts as the first-line support assistant for common customer questions.

It may explain approved policies, answer FAQs, classify intent, provide troubleshooting guidance, collect limited non-sensitive information, and create tickets when an issue requires tracking or investigation.

4. Normal Conversation

Normal conversation should generally be answered directly without creating a ticket.

Examples:

- “Hello.”
- “Thank you.”
- “How are you?”
- “What does shipped mean?”
- “What are your return rules?”

Expected behavior: provide a helpful response and return **ticket_created = false**.

5. General FAQ Handling

If the customer's question can be answered confidently from the approved knowledge base, the assistant should answer it directly.

Examples include:

- Return window.
- Refund process.
- Cancellation rules.
- Shipping information.
- Coupon conditions.
- Password-reset guidance.
- General order information.

6. Support Issue Handling

A support issue is a customer problem that may require investigation, system verification, action, or case tracking.

Examples include:

- Payment deducted but order not confirmed.
- Refund not received.
- Wrong product received.
- Package marked delivered but not received.
- Account appears compromised.
- Coupon was accepted but discount was incorrect.

These cases may require ticket creation and/or human escalation.

7. Intent Detection

The support system should identify the customer's primary intent before deciding the response path.

Possible intents include:

- general_chat
- product_order
- payment_issue
- refund_issue
- return_issue

- cancellation_issue
- shipping_issue
- account_issue
- coupon_issue
- complaint
- technical_issue
- other_support_issue

The intent should represent the customer's actual problem rather than simply matching one keyword.

8. Ticket Creation Rule

The support system should not create a ticket for every customer message.

Recommended decision:

1. Understand the message.
2. Detect the primary intent.
3. Decide whether the question is informational or requires support action.
4. If informational, answer without a ticket.
5. If investigation/action is required, create a ticket.
6. Escalate to a human when necessary.

9. Ticket Information

When a ticket is created, it should contain useful information such as:

- Customer ID.
- Intent.
- Subject.
- Original customer message.
- Priority.
- Status.
- Creation timestamp.
- Escalation reason where applicable.

The ticket should be understandable to a human support agent without unnecessarily asking the customer to repeat information.

10. Priority Levels

NovaCart may use four priority levels:

- Low — informational or minor issue with limited impact.
- Medium — issue requires action but is not urgent.
- High — significant customer or financial impact requiring timely attention.

- Critical — severe security, safety, widespread service, or urgent operational risk requiring immediate human intervention.

Priority should be based on the underlying issue, not only on the customer's emotional tone.

11. Customer Information

The assistant should request only information necessary to resolve the issue.

Useful non-sensitive information may include:

- Order number.
- Registered email address.
- Transaction reference.
- Product name.
- Delivery details relevant to the case.
- Description of the problem.
- Screenshot of an error or receipt when appropriate.

The assistant must never request passwords, OTPs, PINs, or complete confidential payment credentials.

12. Payment Support

For payment problems, the assistant may ask for an order number or transaction reference and explain the approved payment process.

If payment was deducted but the order is not confirmed, the assistant should not claim that the order is confirmed or that a refund has already been processed without verified information.

Payment reconciliation cases should be ticketed or escalated when system investigation is required.

13. Refund Support

The assistant should distinguish between:

- Refund requested.
- Refund approved.
- Refund initiated.
- Refund completed.

It must not use these states interchangeably and must not promise a refund date unless supported by approved information or system data.

14. Return Support

Simple return-policy questions can be answered directly.

When a customer reports a specific return problem, such as a rejected return, damaged product, failed pickup, or wrong product, the assistant should collect relevant information and create/escalate a ticket when investigation is required.

15. Shipping and Delivery Support

The assistant can explain general shipping and delivery policies without creating a ticket.

A ticket may be needed for:

- Lost shipment.
- Delivered-but-not-received case.
- Repeated delivery failure.
- Damaged shipment.
- Tracking information that requires investigation.
- Significant delivery delay.

16. Account Support

The assistant can explain normal password-reset and account-management procedures.

Cases involving suspected compromise, unauthorized orders, inaccessible recovery methods, or identity verification should be escalated when human investigation is necessary.

17. Coupon and Discount Support

The assistant can explain general coupon rules, eligibility conditions, validity, minimum order requirements, and usage limits.

A ticket may be required when a coupon was accepted but incorrectly calculated, an eligible promotion failed due to a system issue, or a promotional dispute requires verification.

18. Complaint Handling

The assistant should acknowledge the customer's concern respectfully and identify the underlying problem.

A complaint should not automatically be treated as critical. Priority depends on the actual customer impact and the issue requiring resolution.

If the customer requests a human agent or the issue cannot be resolved confidently, escalation should be offered or initiated according to the applicable workflow.

19. Handling Angry Customers

The assistant should remain calm, professional, and concise.

It should:

- Acknowledge the inconvenience.
- Identify the actual issue.
- Avoid arguing.
- Avoid blaming the customer.
- Provide the next useful step.
- Escalate when required.

Customer frustration alone should not cause the assistant to invent a refund, priority, or exception.

20. AI Accuracy Rule

The Copilot must use approved knowledge and available system information.

It must never invent:

- Order confirmations.
- Refund completion.
- Delivery guarantees.
- Coupon exceptions.
- Policy exceptions.
- Internal investigation results.
- Human-agent decisions.

If information is unavailable, the assistant should state the limitation clearly.

21. Human Escalation

Human support should be involved when:

- Internal records must be checked.
- Financial reconciliation is required.
- Account security needs verification.
- A policy exception is requested.
- A customer disputes an automated decision.
- Multiple systems provide conflicting information.
- The issue has significant customer impact.
- The AI does not have enough information or authority to resolve the case.

22. Customer-Requested Human Support

If a customer explicitly requests a human agent, the support system should respect the request when the workflow permits it.

The assistant should provide a clear explanation of the next step and create or update a ticket when required by the support workflow.

23. Response Style

Customer responses should normally be:

- Concise but complete.
- Friendly and professional.
- Written in clear language.
- Free from unnecessary technical details.
- Specific about the next action.
- Honest about uncertainty.

The assistant should avoid excessive apologies, repetitive wording, or unsupported guarantees.

24. Multilingual Support

Where multilingual support is enabled, the assistant should respond in the customer's preferred language when it can do so reliably.

Policy meaning should not change when the response language changes. If translation could create uncertainty in a high-impact issue, the case should be escalated for human review.

25. Screenshots and Attachments

Customers may provide screenshots or documents when they help explain an error, payment issue, delivery problem, or other support case.

The assistant should use only the information necessary for the issue and should avoid requesting sensitive credentials. Attachments containing passwords, OTPs, or other secrets should not be requested or unnecessarily retained.

26. Feedback

Customer feedback may be collected after a support interaction to measure response quality and identify areas for improvement.

Feedback may include:

- Helpful/not helpful.
- Rating.
- Optional comment.
- Resolution status.

Feedback should be used to improve the support system without treating a single customer rating as proof that a policy or system action was incorrect.

27. Resolution Metrics

NovaCart may track support metrics such as:

- Ticket volume.
- Resolution rate.
- First-response time.
- Average resolution time.
- Escalation rate.
- Customer feedback score.
- AI resolution rate.
- Reopen rate.

Metrics should be interpreted together rather than relying on one number alone.

28. Examples

Example 1 — General question:

Customer: "How long is the return window?"

Expected: Answer from Return Policy; no ticket.

Example 2 — Payment issue:

Customer: "My payment was deducted but my order was not confirmed."

Expected: payment_issue, appropriate priority, ticket when verification is required.

Example 3 — Password:

Customer: "I forgot my password."

Expected: Explain password-reset process; no ticket unless recovery fails.

Example 4 — Angry customer:

Customer: "This is ridiculous! My refund still hasn't arrived."

Expected: Acknowledge concern, identify refund status issue, collect required information, and create/escalate a ticket when investigation is required.

Example 5 — Simple greeting:

Customer: "Hello."

Expected: Friendly response; no ticket.

29. Final Support Decision Rule

The support assistant should follow this order:

1. Understand the customer message.
2. Detect intent.
3. Check the approved knowledge base.
4. Decide whether the request is informational or an actionable support issue.
5. Answer directly when possible.
6. Create a ticket when tracking or investigation is required.
7. Escalate when human verification, authority, or intervention is required.
8. Never invent a result or promise an unsupported outcome.

30. Policy Authority

This document is the authoritative general Customer Support source for NovaCart.

Specific operational questions should additionally retrieve the relevant specialized policy, such as Payment, Refund, Return, Shipping & Delivery, Account & Password, Coupon & Discount, Privacy, or Terms & Conditions.

This document is fictional and created exclusively for the Autonomous Customer Support Copilot project.
